

Reflection Questions lab3

1. Which Agile principle was easiest to implement using Taiga?

The Agile principle that was easiest to implement was “Deliver working software frequently.”

Using Taiga, sprints can be created with defined start and end dates, enabling structured iterative development. User stories are moved from the product backlog into sprints, and progress is tracked visually through the task board (To Do, In Progress, Done). This makes incremental delivery measurable and transparent, directly supporting frequent delivery of working software.

2. Which Agile principle was difficult to represent using a tool?

The most difficult principle to represent was “Build projects around motivated individuals and trust them to get the job done.”

Although Taiga allows task assignments and progress tracking, it cannot measure team motivation, trust, or morale. These elements depend on leadership, communication, and team culture rather than tool functionality. Therefore, this principle is more human-centered and less tool-dependent.

3. How does Taiga support collaboration and transparency?

Taiga enhances collaboration and transparency through shared backlogs, sprint boards, task assignments, and comment sections. All team members can view project priorities, responsibilities, and progress in real time. Activity logs and updates ensure accountability and reduce miscommunication, promoting a transparent development environment.

4. Can Agile values exist without tools? Justify your answer.

Yes, Agile values can exist without tools. Agile emphasizes individuals and interactions, customer collaboration, and adaptability to change. These values can be practiced using simple methods such as face-to-face communication, whiteboards, or manual tracking systems. Tools like Taiga improve efficiency and scalability, especially in larger or distributed teams, but they are not essential for implementing Agile values.
